

Cyber Security Management System

Protect your organization and customers with our Cyber Security Management System

The Challenges

Today's data center operational models have seen a 3000 percent increase in network connections per second and over 100,000 new security threats every day.

Approximately 10 million cyber security incidents occur every day, causing \$3 billion worth of stolen IP. The average cost of a single successful data breach is US\$5.9 million.

Traditional security solutions are complex and fragmented across the enterprise, making businesses reluctant or unable to address the increasing cyber risks.

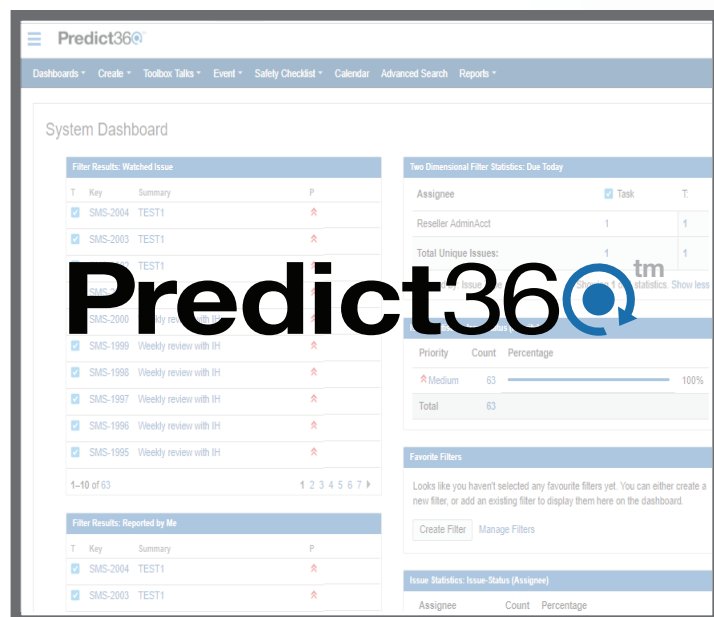

Our Solution

Predict360™ Cyber Security Software uses big data approach as a competitive differentiator to prioritize cyber security risk. It vertically integrates all modules which allow organizations to manage their cyber security compliance programs based on federal and state regulations through a single platform. It helps organizations identify and prioritize high-risk cyber security threats.

The software is capable of detecting security threats that are currently not detected by signature based or SIEM systems (malevolent bots and .exes), and enhances productivity of threat monitoring teams by cutting down reaction time.

Key Features

- Ingests Structured + Unstructured Data.
- Gathers Threat Intelligence via Honeypots, etc.
- Identifies Threats & Anomalies.
- Aggregates knowledge in a Graph-based DB.
- Uses dynamic NLP for automated threat research.
- Develops signatures and rules to block threats.
- Reduces the number of false positives by up to 25%.
